

HTTP/1.1 402 PAYMENT REQUIRED

SolGig

The store AI agents buy from, on Solana.

Ask for a product, get a price in SOL or USDC, pay, ask again. The file comes back with an on-chain receipt.

THE PROBLEM

Agents can pay now. They have nowhere to shop.

No card, no bank

An agent cannot pass KYC or a card check. It can sign a Solana transaction.

Rails, not shelves

x402 tools on Solana charge for API calls. None of them list goods from many sellers.

Stores assume a browser

Checkout pages, cookies and captchas block a buyer that is a script.

THE SOLUTION

Every SolGig product answers HTTP 402 with a price.

Catalog for machines

One JSON endpoint lists every product, price and purchase URL, with a JSON Schema.

SOL or USDC

The 402 lists both, with exact transfers and instructions ready to sign.

Receipt on-chain

The answer carries the transaction signature. Anyone can check the purchase.

DEMO

A fresh keypair buys a file in two requests.

1. GET the product, receive 402
2. Sign the listed transfers
3. GET again with X-PAYMENT
4. Receive file and receipt

Built so a machine can be a customer

Every product is an x402 resource. Ask for it, get told the price, pay, ask again, get the file. No account, no SDK, no API key to beg for.

HTTP 402, paid in SOL or USDC

GET /api/agent/products/<slug> answers 402 Payment Required with the exact transfers, even ready-to-sign instructions. Pay, retry with the signature in X-PAYMENT, and the file comes back. The wallet that paid is the account.

A catalog written for machines

GET /api/agent/catalog lists every product with prices in both SOL and USDC, a purchase URL, and a JSON Schema at /api/agent/schema. An agent that has never seen SolGig can buy from that one response.

A receipt the chain backs up

The server pulls the payment from the chain and checks signer, amounts and fee itself. The receipt it hands back carries the transaction signature, so anyone can verify the purchase. A signature clears exactly one order, ever.

```
agent — Solana
$ node agent.mjs
[agent]  new wallet GHosw...WMs1w — no history, no account
[catalog] GET /api/agent/catalog → picked "Pixel Icon Pack Vol. 2" (0.4 SOL)
```

Try it yourself: a fresh keypair with no history discovers a product, pays for it, and downloads it. About thirty seconds, no browser, no human.

Video: pitch/demo.mp4 · client: scripts/agent-x402.mjs · 4

Nothing ships until the chain agrees.

Before step 4 the server reads the tx from RPC and checks signer, network, time and balance changes (lamports, or USDC by owner and mint). One signature settles one purchase; a reused one gets 409.

Payment rails exist. The storefront on top does not.

Project	What it does	Gap SolGig fills
MCPay, Corbits (prize winners)	Charge agents per API or MCP call over 402	No goods, no seller catalog
Latinum (prize winner)	Wallet and middleware for MCP payments	Pays, does not sell
x402 SDK for Solana	Library for 402 micropayments	Tooling, not a store
Tedix	Agent buys via MCP and x402	Closest match; the one to watch
HiveHub, CredChain, SolancePRo	Freelance marketplaces with escrow	Human buyers only

EXECUTION

Already live on mainnet, in twenty languages.

2

live deployments: mainnet and devnet

20

UI languages

14 KB

Pinocchio escrow program, 24 end-to-end tests

69

web tests passing, x402 flow included

FOR PEOPLE TOO

People buy the same listings, with escrow for services.

- Wallet sign-in, no password
- Service money held in a program PDA
- Buyer releases, or reclaims after 14 days
- Feed, follows and reviews

Every seller is visible to agents and people with no extra work · 8

BUSINESS MODEL

2.5%

of every sale, taken in the same transaction.

A 1 SOL sale sends 0.975 SOL to the seller and 0.025 SOL to the treasury in one transfer. No invoicing, no payout run. Same split for USDC.

Next: escrowed services over x402, then agent budgets.

NOW	NEXT	THEN	LATER
x402 goods SOL and USDC, receipts (PR #4)	x402 services 402 that opens a program escrow	Agent budgets Spending caps and allow-lists	MCP server SolGig as a tool in agent frameworks

TEAM

One builder shipped the app, program and agent API.

THE ASK

Help us put the first agent store in every agent framework.

- [Funding amount] for 6 months of build and audits
- Intros to agent framework teams and x402 facilitators
- Sellers with digital goods agents already need

```
curl -i solgig-mainnet.vercel.app/api/agent/catalog
```
